Overdose Response Strategy

COLLABORATE across public health and public safety sectors

SHARE data, insights and trends we are seeing related to drug overdose in our communities

INFORM AND HELP local communities develop local solutions to reduce overdoses and save lives

Liberty Mid-Atlantic HIDTA

- HIDTA = High Intensity Drug Trafficking Areas
- Funded by the Office of National Drug Control Policy (ONDCP)
- A "Program" not an "Agency"
- Collaboration of federal, state, local, and tribal agencies
- Purpose: Reduce drug trafficking and production in the US
- Started the Overdose Response Strategy (ORS) in 2016

HIDTA in Pennsylvania

6 Eastern Counties Part of LMA HIDTA:

- Philadelphia
- Bucks
- Montgomery
- Chester
- Delaware
- Lehigh

6 Western Counties Part of Ohio HIDTA:

- Erie
- Lawrence
- Beaver
- Washington
- Allegheny
- Westmoreland

Beyond Fatality Data

Other sources can be helpful in identifying drug trends more quickly than decedent data

- Delays in testing
- Testing isn't always comprehensive
- Delays in reporting
- Not all novel substances or trends cause an increase in fatal overdoses (or not right away)
- Unclear how/when substances are consumed

Terminology

Adulterants

Pharmacologically active ingredients intentionally added to enhance or mimic effects.

- *Example: xylazine makes fentanyl last longer*

Dilutants

Inert substances intentionally added for bulk to increase profits

- *Example: talcum powder or sugar added to cocaine*

Contaminants

Unintentionally added; cross contamination

- *Example: fentanyl residue is accidentally transferred to cocaine supply on equipment*

Current Drug Trends

- Fentanyl continues to be the driver behind overdoses
- Stimulants (methamphetamine and cocaine)
- Counterfeit Pills
- Novel Psychoactive Substances (NPS)
 - Benzodiazepines
 - Novel Synthetic Opioids / Nitazenes
 - Hallucinogens/Stimulants
- Xylazine
- Polysubstance use as the norm
- Other emerging substances

> Opioids and Stimulants

Deaths

Estimated Drug Overdose Deaths, 2017 – 2024*

PA opioid deaths down **-10.4%** in 2023 compared with 2022

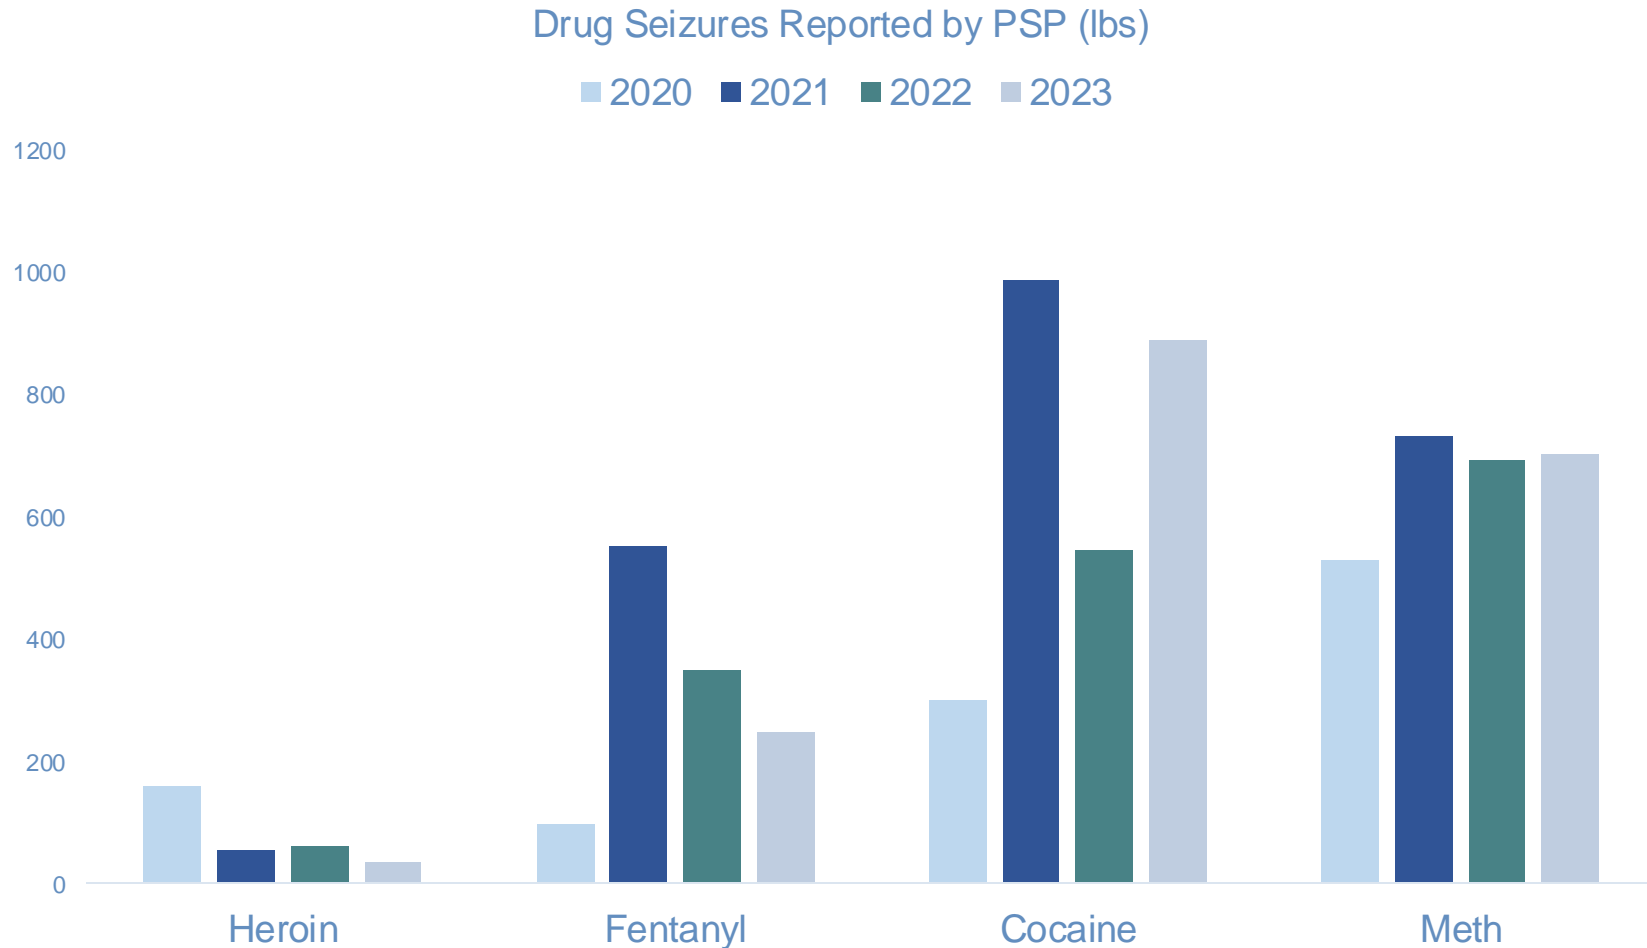

*2023/2024 death data is preliminary, based on death record data as of August 2024. Please note that death records for overdose deaths are often delayed by 3-6 months and counts may change. Counts do not include suicides or homicides where someone intended to harm another person by poisoning.

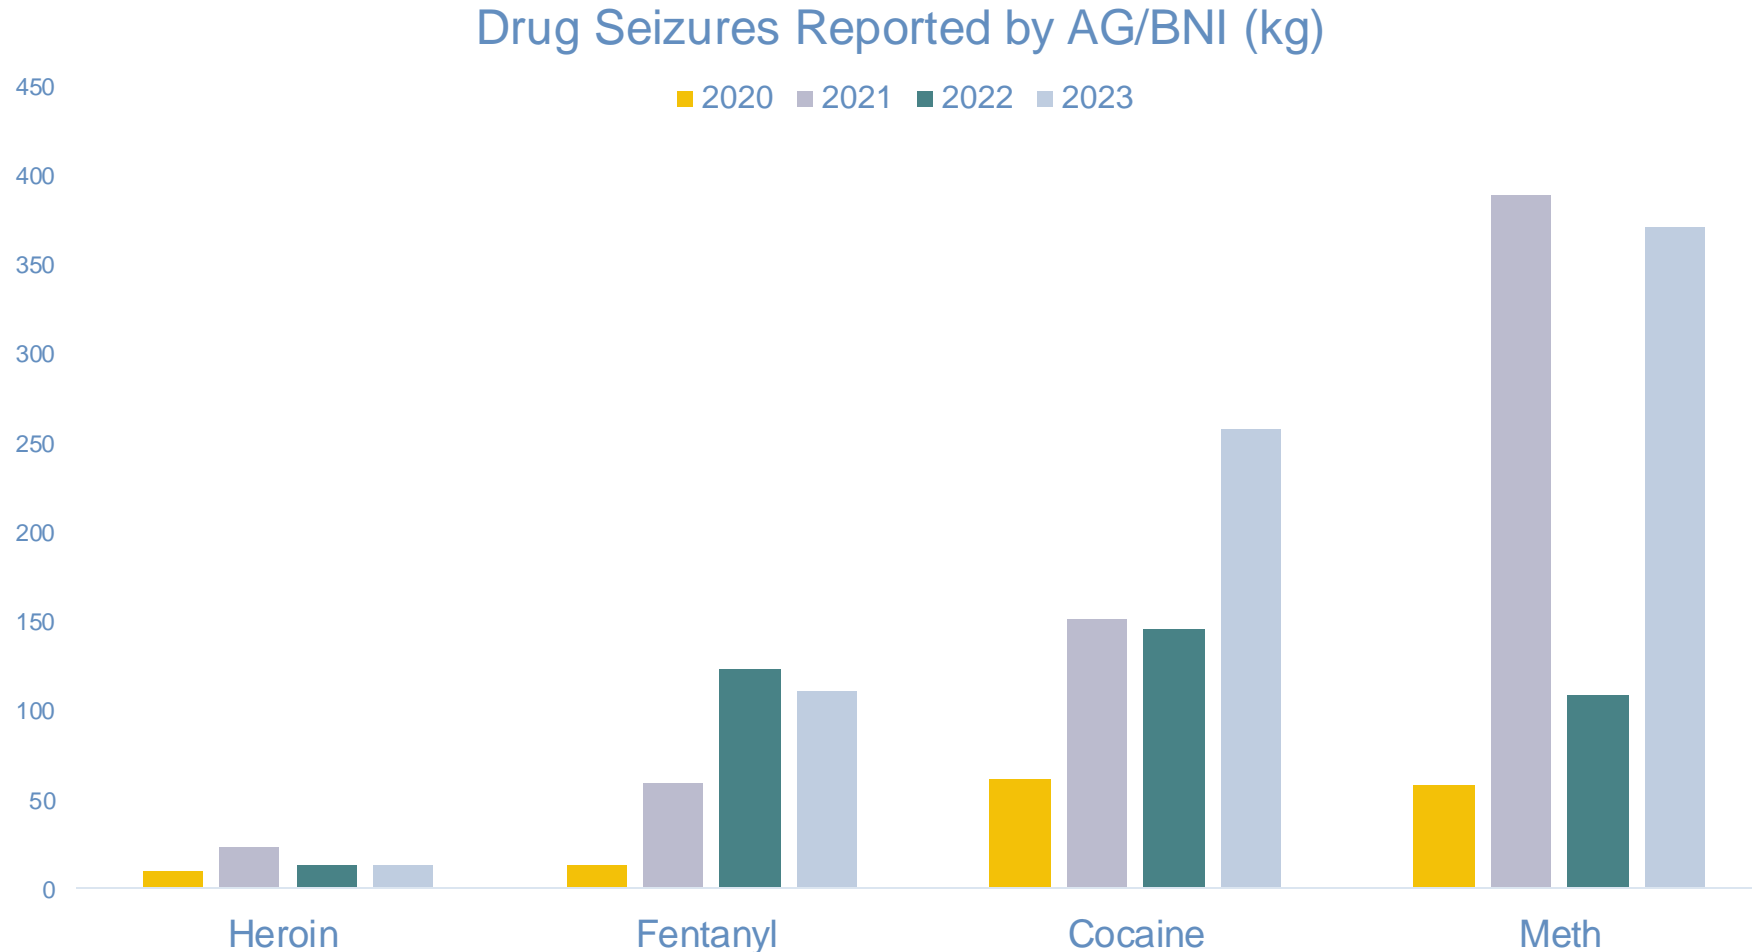

†As of August 2024, ~2% of 2023 and ~16% of 2024 overdose deaths are missing drug specificity. Previous years are missing ≤5%.

Drug Seizures - State Police Opioids and Stimulants 2020-2023

Drug Seizures - Attorney General Opioids and Stimulants 2020-2023

> Counterfeit Pills

Counterfeit Pills

- Types: Oxycodone M30, Adderall, Xanax
 - Fentanyl and Methamphetamine
- Dark Web and Social Media
- Pill Presses

Department of Justice/Drug Enforcement Administration
Drug Fact Sheet

Counterfeit Pills

WHAT ARE COUNTERFEIT PILLS?

Counterfeit pills are fake medications that have different ingredients than the actual medication. They may contain no active ingredient, the wrong active ingredient, or have the right ingredient but in an incorrect quantity. Counterfeit pills may contain lethal amounts of fentanyl or methamphetamine and are extremely dangerous because they often appear identical to legitimate prescription pills, and the user is likely unaware of how lethal they can be.

WHAT IS THEIR ORIGIN?

The majority of counterfeit drug production occurs in other countries, mainly China, Mexico, and India. Furthermore, an increasing number of pills laced with fentanyl are being produced in the U.S. Mexican and domestic drug trafficking organizations operating in the U.S. produce counterfeit pills with pre-made chemicals and drugs from China and/or Mexico. They are usually produced in substandard conditions, labeled incorrectly, and may include dangerous, unapproved substances. There are no quality control mechanisms in the illicit labs producing counterfeit pills to ensure dosing is not lethal. Online sales via internet marketplaces and social media are the major sources for obtaining counterfeit pills.

A significant number of high school and college students purchase Adderall and Xanax from dark web drug markets and/or through social media referrals¹, which market deadly versions of these drugs tainted with fentanyl and/or methamphetamine. Some students begin using prescription stimulants, often referred to as "study drugs," in the belief it will benefit their academic performance, but the nonmedical use of prescription stimulants has not been proven to improve academic performance².

Left: Authentic oxycodone M30 tablets (top) vs. counterfeit oxycodone M30 tablets containing fentanyl (bottom). Center: Authentic Adderall tablets (top) vs. counterfeit Adderall tablets containing methamphetamine (bottom). Right: Authentic Xanax tablets (white) vs. counterfeit Xanax tablets containing fentanyl (yellow).

What are common street names?

Counterfeit oxycodone M30 pills: Mexican Blues, Blues, M-Boxes

Designer Benzodiazepines - Bromazolam

- Powder and pill form, mixed with heroin or fentanyl
- Combined with opioids: "Benzo Dope"

WHAT IS BROMAZOLAM?
Street Name: "Benzo Dope"

Overview
Bromazolam is a synthetic designer benzodiazepine. Designer benzodiazepines are a public health concern due to their high potency and combination with illicit opioids. Designer benzodiazepines can appear in a variety of preparations (powder, liquid, counterfeit pills).¹

Emergence of Designer Benzodiazepines

- A new addition to the illicit drug supply is the presence of synthetic benzodiazepine-laced opioids, referred to as "benzo dope".¹
- The sedative effects of benzodiazepines combined with opioids increases the risk for respiratory depression and overdose.²
- In New Jersey, bromazolam has been identified in suspected heroin and pill form. Pills testing for bromazolam often mimic counterfeit Xanax or Alprazolam.

In 2022, fentanyl was detected in 97% of suspected heroin containing bromazolam.
New Jersey State Police, Office of Drug Monitoring & Analysis (October 2023)

Bromazolam has been identified in illicit drug samples in **18 of 21** New Jersey counties.

Use of Naloxone for ALL Suspected Overdoses

- Naloxone will not reverse the effects of benzodiazepines but should still be administered because it will reverse the effects of any opioids present.
- Bromazolam and other designer benzodiazepines are commonly found in combination with fentanyl.

1. The Center for Substance Abuse Research & Education, Designer Benzodiazepines: Promoting Safer Use and Reducing Harmful Effects in Part by Including Synthetic Benzodiazepines in the List of Controlled Substances (June 2022).
2. National Institute on Drug Abuse, Benzodiazepines and Opioids (December 2020).

Benzodiazepines – Q3 2024

Bromazolam

- Made up half of all drug samples sent to NPS Discovery in Q3 2024
- Scheduled in March 2024
 - Possible replacement:
Phenazolam ("clobromazolam")

Benzodiazepines contributed to 59 deaths in Pennsylvania in 2022, increasing to **147** in 2023

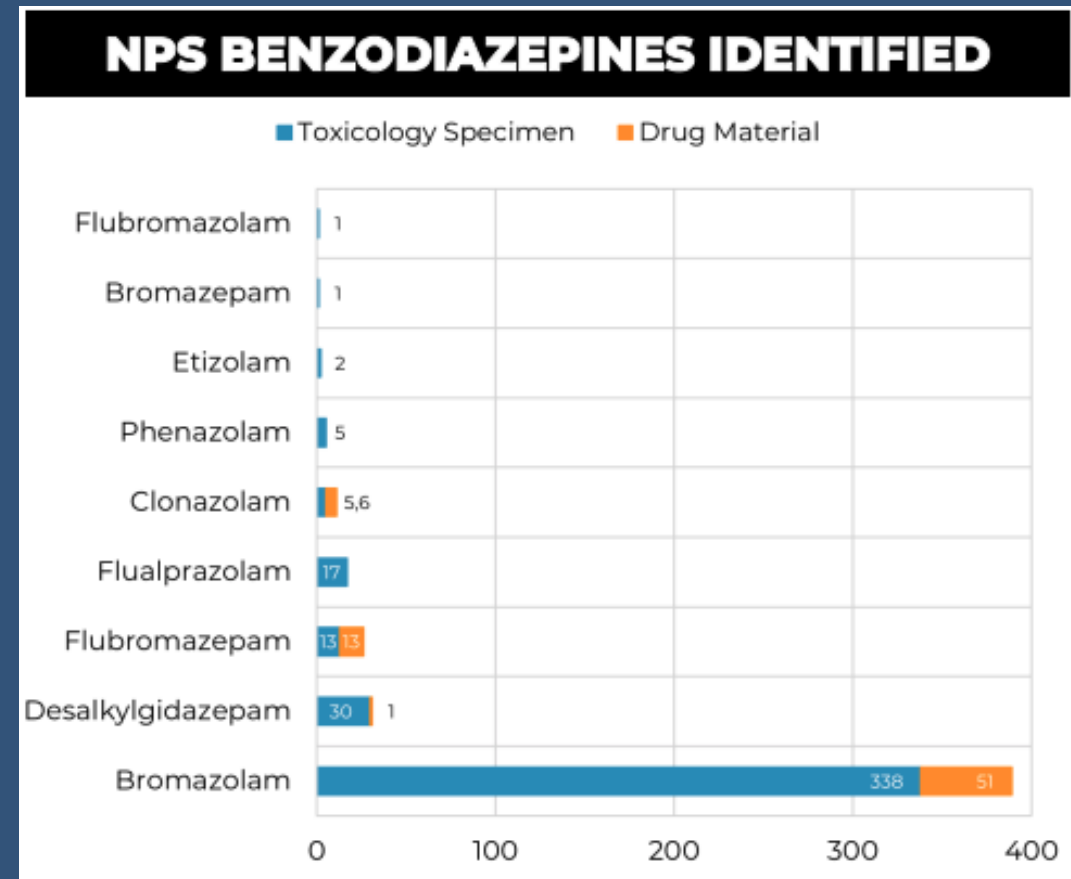

Image Source: CFSRE.org/

Novel Synthetic Opioids - Nitazenes

Potent analgesic (painkiller) and sedative properties

- Examples: Protonitazene, Isotonitazene

WHAT ARE NITAZENES?

Overview
Nitazenes and their analogs are synthetic novel opioids with a potency similar to, or greater than, the potency of fentanyl. Nitazenes can appear in a variety of colors and preparations (powder, liquid, counterfeit pills). The Drug Enforcement Administration (DEA) has classified ten nitazene analogs as Schedule I drugs.

The Presence of Nitazenes in the Illicit Market
The Drug Enforcement Administration (DEA) has warned that nitazene analogs are being used to make drugs more potent and cheaper to produce. DEA forensic laboratories have identified the mixing of nitazene analogs with fentanyl/heroin and marketed as common street drugs.¹

Nitazenes were first analyzed in New Jersey in 2021. The chart below shows suspected heroin cases containing nitazenes in the state.²

Year	Number of Cases
2021	5
2022	16
2023 (to 6/30)	28

Scheduled nitazene analogs include:

- Butonitazene
- Clonitazene
- Etodesnitazene*
- Etonitazene
- N-pyrrolidino* etonitazene
- Isotonitazene*
- Metodesnitazene
- Metonitazene*
- Flunitazene
- Protonitazene*

* Identified in New Jersey's drug environment.

Recommendations for Law Enforcement
First responders should approach all suspected overdose victims and drug seizures as though fentanyl or other opioids are present. Naloxone is effective in reversing nitazene-related overdoses. Multiple doses may be needed based on symptoms of victim.

² New Jersey State Police, Office of Drug Monitoring & Analysis (August 2023).

Request for Information and Contact Information: Any agency with additional information regarding this topic, or with questions about this product, may contact the Drug Monitoring Initiative (DMI), Office of Drug Monitoring & Analysis at DMI@njsp.gov.

September 2023

Image Sources: NJ State police, CFSRE.org, PA State Police

Novel Synthetic Opioids - Nitazenes

- Fluorofentanyl most prevalent and not on the chart because there were more than 300 detections
- "-orphine" analogs appear to be the possible next big thing

Nitazenes contributed to <6 deaths in PA in 2022, increasing to **15** in 2023

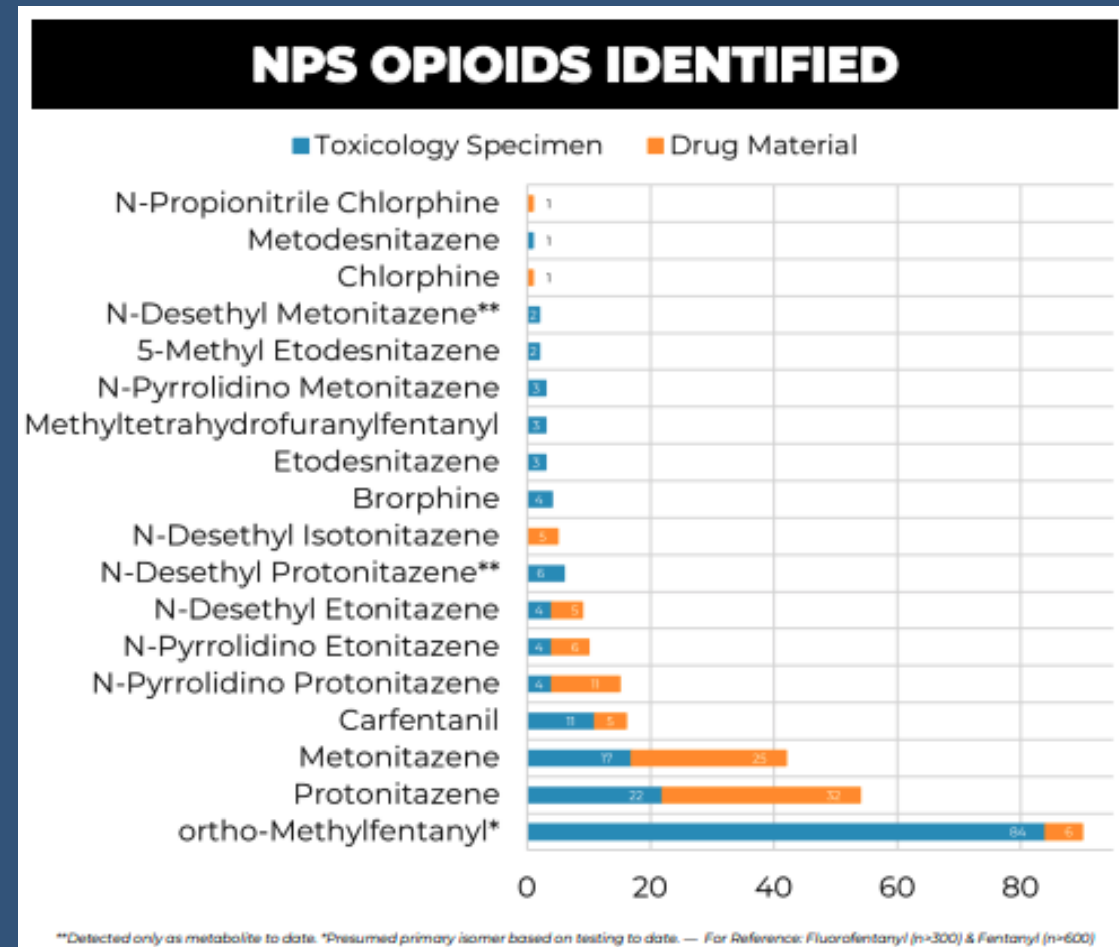

Image Sources: CFSRE

Stimulants and Hallucinogens

- Dimethylpentylone most common stimulant. Internationally scheduled in March 2024.
- 2F-2oxo-PCE most prevalent hallucinogen, often sold as and/or mixed with ketamine
- Watching: **N-Isopropyl Butylone, MMC and CMS, 2Cs**

Image Source: CFSRE.org

"Tusi" (2-C or 2-CB)

- "Pink cocaine"
- Popular in active night club areas as a "club drug"
- In 2021, "Tusi" was seized five times in NJ; in Q1-Q2 2024 it has been seized 12 times
- Originally a psychedelic phenylethylamine
- Polydrug mixture sold as synthetic cocaine
 - Ketamine and MDMA
 - Methamphetamine, ketamine, and MDMA
 - Cocaine and fentanyl
 - Fentanyl and xylazine
- DEA has seized 960 pink powders since 2020
 - Only four samples were actually 2-C

Image sources: DEA

"CanKet" (2F-2oxo-PCE)

- Synthetic hallucinogen
- Structurally similar to ketamine
- First reported in drug checking program in early 2022 in Australia
- 88+ detections in at least ten states and Canada, including Pennsylvania
- Not scheduled
- More than 60% of samples also contained opioids, primarily fentanyl
- Also with xylazine, other NPS benzodiazepines, nitazene analogues

2F-2OXO-PCE — A NEW SYNTHETIC HALLUCINOGEN IDENTIFIED IN RECREATIONAL DRUG MARKETS ACROSS NORTH AMERICA

PURPOSE: The objective of this announcement is to notify public health and safety, law enforcement, first responders, clinicians, medical examiners and coroners, forensic and clinical laboratory personnel, and all other related communities about new information surrounding the emergent novel synthetic hallucinogen **2F-2oxo-PCE** (also referred to as "2-fluoro DCNEK", "2-FXE", and "CanKet").

BACKGROUND: Synthetic hallucinogens (typically subcategorized as analogues of ketamine, PCP, and LSD) are chemically manufactured drugs that act on the serotonin (5-HT_{2A}) or N-methyl-D-aspartate (NMDA) receptors in the brain. Synthetic hallucinogens are often substituted for traditional hallucinogens and distributed as powders, capsules, or tablets. Traditional hallucinogens in the arylcyclohexamine subclass (i.e., analogues of PCP or ketamine) exhibit anesthetic and dissociative effects, which can lead to significant adverse reactions when these drugs are consumed recreationally. In the United States (U.S.), synthetic hallucinogens have been associated with severe adverse effects such as hyperthermia, dehydration, seizures, hallucinations, serotonin syndrome, and cardiac symptoms, potentially resulting in death.

SUMMARY: 2F-2oxo-PCE is a novel synthetic hallucinogen that bears structural resemblance to ketamine and previously encountered novel dissociatives (e.g., **hydroxetamine**, **MeO-PCE**, and **HO-PCE**). 2F-2oxo-PCE is a positional isomer of **fluorexetamine** (also known as FXE or 3F-2oxo-PCE). Ketamine is regulated by the U.S. Drug Enforcement Administration (DEA) as a Schedule III drug under the Controlled Substances Act; however, neither 2F-2oxo-PCE nor fluorexetamine are currently scheduled substances. There is limited pharmacological information for 2F-2oxo-PCE; however, it is understood that 2F-2oxo-PCE is an active drug and it is hypothesized to act similarly to ketamine *in vivo* producing dissociative effects.

2F-2oxo-PCE was first reported in early 2022 by the Australian drug checking service CanTEST. Scientists in Canberra, Australia, first referred to the novel, unknown ketamine-like drug as "CanKet" before confirming its structure. Later that year, in December 2022, CFSRE's NPS Discovery reported our first case involving an indiscriminate isomer of "fluorexetamine" by LC-QTOF-MS analysis only. As of May 2024, 2F-2oxo-PCE has now been identified in more than 20 drug materials and 35 toxicology specimens. More than 60% of the drug materials containing 2F-2oxo-PCE also contained opioids, primarily fentanyl. Xylazine, NPS benzodiazepines, and nitazene analogues were common co-occurrences alongside 2F-2oxo-PCE. Cases originated from at least nine states or provinces across the U.S. and Canada. In five postmortem cases, ages ranged from approx. 20 to 40 years. The toxicity of 2F-2oxo-PCE has not been formally examined but recent associations with intoxication and death lead professionals to believe that this drug has the potential to cause harm and is of high public health concern, when mixed with other drugs or when consumed alone at high doses.

DRUG MATERIALS CONTAINING 2F-2OXO-PCE	
SUSPECTED CONTENTS	QUALITATIVE RESULTS (RELATIVE PARTS)
"Heroin"	Bromazolam (1p), Fentanyl (0.6p), Fluorazepam (0.1p), 2F-2oxo-PCE (0.1p), Heroin (0.1p), N-Desethyl isotonitazene (trace), Propofol (2-4p), Xylazine (0.5p), Caffeine (0.3p), 4-ANPP (0.3p), Phenethyl-4-ANPP (trace)
Unknown	Fentanyl (1p), 2F-2oxo-PCE (0.1p), para-Fluorofentanyl (trace), 4-ANPP (0.1p)
"Fluorexetamine"	2F-2oxo-PCE (1p), Ketamine (0.1p), Methamphetamine (trace), Cocaine (trace)
"Fentanyl"	Fentanyl (1p), 2F-2oxo-PCE (0.3p), para-Fluorofentanyl (trace), Xylazine (0.2p), Caffeine (2.1p), Propofol (0.8p), 4-ANPP (0.3p), Lidocaine (0.1p), Quinine (0.2p)
"Dope"	2F-2oxo-PCE (1p), Bromazolam (0.4p), Fentanyl (0.2p), Tiletamine (0.2p), Xylazine (85p), Phenacetin (2.6p), Caffeine (0.2p), 4-ANPP (0.1p)
Unknown	2F-2oxo-PCE (1p), Methamphetamine (0.1p), Xylazine (0.7p), N-Pyrrolidino Protonitazene (trace), Protonitazene (trace)
"K" (Paper Strips)	MCHS-88P-PNACA (1p), AB-CHMINACA (0.8p), 2F-2oxo-PCE (0.2p), ADB-4en-PNACA (0.1p), Metonitazene (trace), Fentanyl (trace)

TOXICOLOGY SPECIMENS CONTAINING 2F-2OXO-PCE	
SAMPLE TYPE	QUALITATIVE RESULTS
Uric Blood	Methamphetamine, 2F-2oxo-PCE, Ketamine, Norketamine, N-Desethyl Etionitazene
Blood	2F-2oxo-PCE, Ketamine, Norketamine, 7-Aminoclonazepam
Heart Blood	N-Ethyl Deschloroketamine, 2F-2oxo-PCE, Bromazolam, N-Desmethyl Loperamide, N,N-Diisopropyl Loperamide
Femoral Blood	Acetaminophen, Phenacetin, Xylazine, 4-Hydroxy Xylazine, 2F-2oxo-PCE, Ketamine, Norketamine, Cocaine, Benzoylcarbazone, Norcocaine, Cocacethylene, Ecgonine Methyl Ester, Naloxone, Flubromazepam, 3-Hydroxy Flubromazepam, Fentanyl, Norfentanyl, 4-ANPP, para-Fluorofentanyl, Quetiapine
Femoral Blood	Acetaminophen, 2F-2oxo-PCE, Doxylamine, Sertraline, Naloxone, Trazodone, Hydroxyzine, Isotonitazene, N-Desethyl isotonitazene, 5-Aminoisotonitazene
Blood	Methamphetamine, Amphetamine, 2F-2oxo PCE, 7-Amino Clonazepam, Cocaine, Benzoylcarbazone, Norcocaine, Fentanyl, N-Pyrrolidino Protonitazene
Blood	2F-2oxo PCE, N,N-Dimethylpentylone, Metonitazene

> Xylazine

Xylazine Timeline

- 2001
 - First detection in Puerto Rico
- 2006
 - First detection in Philadelphia
- 2018-2019
 - Dramatic increase in xylazine detections in drug overdose deaths in Pennsylvania
- 2023
 - FDA has Customs and Border Patrol increase surveillance and seizure
 - Akorn Pharmaceutical files for bankruptcy
 - Subsequent shift from liquid to powder
 - June: Xylazine scheduled in Pennsylvania
 - July: National Xylazine Response Plan released

Image source: <https://www.whitehouse.gov> [1]

NPS Discovery Drug Checking Project

- Philadelphia Department of Public Health (PDPH) and Center for Forensic Science Research and Education (CFSRE)
- 219 Samples May – Sept 2022 (Q3)
- 91% of "Dope" included *both* fentanyl and xylazine
- Average xylazine purity/concentration was 33.8% (range <1 to 64.8%)

QUARTERLY REPORT — PHILADELPHIA, PA

DRUG CHECKING

Q3 2022

Department of Public Health
CITY OF PHILADELPHIA

136 Number of Dope Samples

49 Number of Tablets (e.g. Oxycodone, Hydrocodone)

10 Drug Tablets (e.g. Oxycodone, Hydrocodone)

24 Drug Samples (e.g. Cocaine, Heroin, Buprenorphine)

Purpose: This report provides up-to-date information regarding the drug supply in Philadelphia, Pennsylvania, United States of America, and is our first Quarterly Drug Checking Report to include quantitative data on the purity of fentanyl, xylazine, cocaine, methamphetamine, and more.

Overview: Traditional drugs (e.g. heroin, fentanyl, cocaine, methamphetamine) are commonly identified among drug samples in cities across the United States, albeit at varying purities and combinations. Novel psychoactive substances (NPS) continue to appear within the drug supply, mixed in traditional drugs or added to traditional drug preparations. Nationally, the drug supply remains a dynamic and evolving environment, especially relating to primary active drug components and cutting agents or adulterants added to drug preparations. The drug purity and drug use trends can be different from city to city or even within a given community, requiring specific regional or local assessments. Accurate understanding of drug materials and the drug supply in real-time is imperative for effective public health and public safety preparedness and response.

Objective: A partnership between the Center for Forensic Science Research and Education (CFSRE) and the Philadelphia Department of Public Health (PDPH) has been established to accurately assess the drug supply in Philadelphia, Pennsylvania. This initiative was established as a comprehensive effort examining various drug materials and drug forms, select drug testing results from samples obtained within the city were compiled for preparation of this report. The results reported herein represent a subset of the drug supply and not its entirety.

Acknowledgments: This report was prepared by Alex J. Mowbray, PhD, Jim Swartzell, MS, Jeffrey DeWitt, PhD, David Torres de Silva, MS, and Sara A. Logan, MS, EMT. The authors acknowledge CFSRE and PDPH personnel for their contributions and involvement. This work is funded by the Center for Disease Control and Prevention (CDC) through an Overdose Detection grant awarded to the City of Philadelphia. The authors, findings, conclusions, and/or recommendations expressed in this public document are those of the authors and do not necessarily reflect those of the CDC or other federal state, local, or private agencies. For more information about drug checking services at NPS Discovery, please contact info@npsdiscovery.org or [215-575-1234](tel:215-575-1234).

Summary and Key Findings:

- 219 samples were tested between May and September 2022
- Fentanyl/xylazine (brand/dope) proportions varied greatly
- The average fentanyl purity was 11.7% (range 0.3-34.8%)
- The average xylazine purity was 33.8% (range 0-64.8%)
- Most dope samples (91%) contained fentanyl and xylazine
- Synthetic cannabinoids remain dynamic and unpredictable
- Counterfeit Kansas tablets tested positive for clonazepam
- Cocaine purity varied greatly (average: 37.8%, range 0.3-65.8%)

Date	Suspected	Drugs Identified
9/13/2022	Dope	Fentanyl (18.4%), Xylazine (26.9%), 4-ANPP (10.6%) <small>zpm-142</small>
9/21/2022	Dope	Fentanyl (6.6%), Xylazine (40.5%), 4-ANPP (1.0%), Procaine, Caffeine <small>zpm-142</small>
9/21/2022	Dope	Fentanyl (7.7%), Xylazine (32.4%), para-Fluorofentanyl (0.3%), 4-ANPP (0.7%) <small>zpm-142</small>
9/21/2022	Dope	Fentanyl (7.8%), Xylazine (26.6%), 4-ANPP (1.5%) <small>zpm-142</small>
9/21/2022	Dope	Fentanyl (8.2%), Xylazine (58.4%), 4-ANPP (0.6%) <small>zpm-142</small>
9/21/2022	Dope	Fentanyl (8.3%), Xylazine (26.3%), 4-ANPP (1.6%) <small>zpm-142</small>

NPS Discovery Drug Checking Project

- 344 Samples January – June 2023 (Q1 and Q2)
- 99% of "Dope" included *both* fentanyl and xylazine
- Average xylazine purity/concentration increased to 46.1%
- Stimulant samples contained fentanyl (n=10)
- Bromazolam detected *without* opioids (n=2) in "dope" samples

Drug Checking — Quarterly Report
PHILADELPHIA, PENNSYLVANIA
DRUG CHECKING
Q1 & Q2 2023

PURPOSE: This report provides up-to-date information regarding the drug supply in Philadelphia, Pennsylvania, United States of America, including quantitative data on the purity of fentanyl, xylazine, cocaine, methamphetamine, and more in various sample types analyzed.

OVERVIEW: Traditional drugs (e.g., heroin, fentanyl, cocaine, methamphetamine) are commonly identified among drug samples in cities across the United States, albeit at varying purities and combinations. Novel psychoactive substances (NPS) continue to appear within the drug supply, masked as traditional drugs or added to traditional drug preparations. Nationally, the drug supply remains a dynamic and evolving environment, with respect to the active drug components, cutting agents, and/or adulterants added to drug preparations. The drug supply and drug use trends can be different from city to city or even within a given community, requiring specific regional or local assessments. Accurate understanding of drug materials and the drug supply in real-time is imperative for effective public health and safety preparedness and response.

OBJECTIVE: A partnership between the Center for Forensic Science Research and Education (CFSRE) and the Philadelphia Department of Public Health (DPH) has been established to accurately assess the drug supply in Philadelphia, Pennsylvania. Samples were provided to DPH staff conducting field-based harm reduction supply distribution and forwarded to the CFSRE for analysis. The CFSRE laboratory utilizes novel approaches for the analysis of drugs using comprehensive non-targeted data acquisition by gas chromatography mass spectrometry (GC-MS) and liquid chromatography quadrupole time-of-flight mass spectrometry (LC-QTOF-MS). The scope of analysis for testing contains more than 1,100 drugs, including a vast majority of NPS and relevant substances. This initiative was established as a comprehensive effort examining various drug materials and drug forms. All drug testing results are summarized in this report, with notable results selected for emphasis. Note: The results reported herein represent a subset of the drug supply and do not represent the drug supply in its entirety.

Emerging Fatal Overdose Trends: Xylazine in Pennsylvania (n=count where xylazine noted as contributing to death)

■ Xylazine Noted as Contributing to Death

Please note that not all counties participate in our Enhanced Drug Overdose Death Surveillance efforts. A county that is indicated in grey does not necessarily mean that xylazine has not been detected. Counts between 1 and 5 are suppressed.

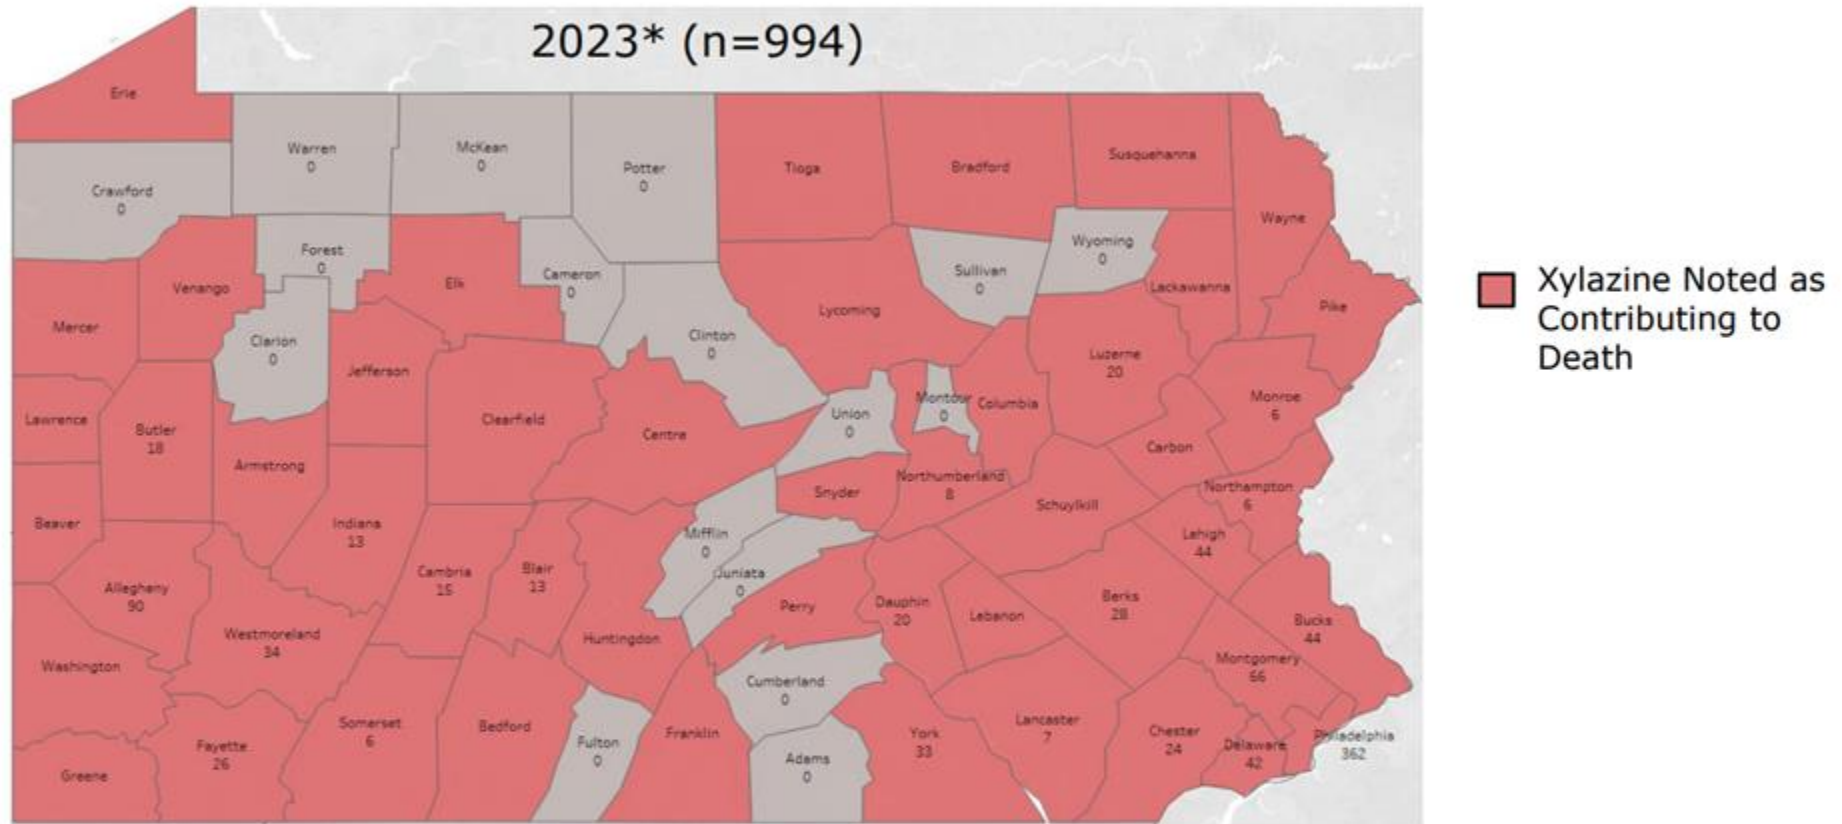

Emerging Fatal Overdose Trends: Xylazine in Pennsylvania (n=count where xylazine noted as contributing to death)

*2022 death data is preliminary, based on death record data as of March 2024. Please note that death records for overdose deaths are often delayed by 3-6 months and counts may change. Counts do not include suicides or homicides where someone intended to harm another person by poisoning. As of March 2024, ~2% of 2022 overdose deaths are missing drug specificity. Previous years are missing $\leq 5\%$.

Please note that not all counties participate in our Enhanced Drug Overdose Death Surveillance efforts. A county that is indicated in grey does not necessarily mean that xylazine has not been detected. Counts between 1 and 5 are suppressed.

Emerging Fatal Overdose Trends: Xylazine in Pennsylvania (n=count where xylazine noted as contributing to death)

*2023 death data is preliminary, based on death record data as of March 2024. Please note that death records for overdose deaths are often delayed by 3-6 months and counts may change. Counts do not include suicides or homicides where someone intended to harm another person by poisoning.

As of March 2024, ~6% of 2023 overdose deaths are missing drug specificity. Previous years are missing $\leq 5\%$.

Please note that not all counties participate in our Enhanced Drug Overdose Death Surveillance efforts. A county that is indicated in grey does not necessarily mean that xylazine has not been detected. Counts between 1 and 5 are suppressed.

Rapid Increase in Xylazine-Related Deaths

Year	Number of Overdose Deaths where Xylazine Contributed to Death	Number of Counties where Xylazine Contributed to Death
2017	0	0
2018	51	3
2019	259	17
2020	377	17
2021	576	30
2022*	762	40
2023*	994	50

*2022/2023 death data is preliminary, based on death record data as of March 2024. Please note that death records for overdose deaths are often delayed by 3-6 months and counts may change. Counts do not include suicides or homicides where someone intended to harm another person by poisoning.

†As of March 2024, ~2% of 2022 and ~6% of 2023 overdose deaths are missing drug specificity. Previous years are missing ≤5%.

> Polysubstance Use

More Questions than Answers

- What we know: Polysubstance use is the norm
- Questions:
 - Are people consuming multiple substances knowingly, on purpose?
 - Are people intentionally using multiple substances concurrently or at different times and/or for different reasons?
 - If dealers are intentionally mixing substances, at what retail level, why?
 - Which substances are present because of contamination?

Lab Testing Shows that Street Drugs Increasingly Complex

Drug Checking — Q2 2022

Philadelphia, PA

Data Collected:

- Reported use
- Cheek swab

800+ samples April 2023-date

Possible duplication of participants

SUBJECT REPORTED USE	TOX RESULTS
FENT/TRANQ 15 MIN	Amphetamine, Methamphetamine, Xylazine, Cocaine, Fentanyl, Fluorofentanyl
METH/DOPE 30 MIN	Amphetamine, Methamphetamine, Xylazine, Cocaine, Fentanyl, Fluorofentanyl
DOPE 30 MIN	Methamphetamine, Xylazine, Cocaine, Fentanyl, Fluorofentanyl
DOPE JUST NOW	Methamphetamine, Xylazine, Cocaine, Fentanyl
DOPE JUST NOW	Methamphetamine, Xylazine, Tramadol, Cocaine, Fentanyl
HEROIN 30 MIN	Amphetamine, Methamphetamine, Xylazine, Cocaine, Fentanyl
FENT HOUR AGO	Methamphetamine, Xylazine, Diphenhydramine, Cocaine, Methadone, Fentanyl, Fluorofentanyl
COKE/FENT 25 MIN	Amphetamine, Methamphetamine, Xylazine, Cocaine, Fentanyl, Fluorofentanyl
HEROIN 20 MIN	Amphetamine, Methamphetamine, Xylazine, Cocaine, Fentanyl, Fluorofentanyl

Substances Identified in DRE Samples

87% of samples contained xylazine

85% each Cocaine and Fentanyl

Mean and mode = four substances/participant

Medetomidine first appeared in September 2024, in 67% of samples

> Other Emerging Substances

Medetomidine

- Synthetic alpha-2 agonist, like xylazine and clonidine - estimated to be up to 200 times stronger
- Recent mass overdose outbreaks in **Philadelphia, Pittsburgh, Chicago**
- Severe adverse effects, including heightened sedation and profound bradycardia (low heart rate)
- Human and veterinary use variations
- Sometimes called "Rhino tranq" by people who use drugs

Image Sources: HIDTA

PDPH Bulletin: <https://bit.ly/3wZRURF>

Deaths in PA so far in 2024

**naloxone + rescue breathing
recommended**

Ketamine

- Dissociative anesthetic with possible hallucinogenic effects
- Federally Schedule III - Can be used therapeutically under supervision
- Symptoms: distortion of perceptions, amnesia, temporary paralysis, dangerously slows breathing, potentially shuts down body systems leading to cardiac arrest or respiratory failure
- Noteworthy law enforcement seizures:
 - 2021: 2+ kilos of fentanyl mixed with ketamine.
First observation of this mixture in PA.
 - 2021: 13 pounds in metal tubes destined for Massachusetts
 - 2023: 22 kilos of candles stuffed with ketamine from Austria
 - 2023: 7 kilos of ketamine hidden in an ottoman

BTMPS ("Bee-Temps")

- bis(2,2,6,6-tetramethyl-4-piperidyl) sebacate
- Widespread across the country (at least 14 states)
- Brand: Tinuvin, industrial, added to plastic as UV protectant
- Identified in mid-June 2024 by FTIR drug checking harm reduction programs on the west coast.
- People Who Use Drugs (PWUD) say that it's awful, smells bad, makes them feel sick immediately
- Found in pressed pills and powder
- No psychoactive properties
- Likely added intentionally by dealers (not accidental contamination)

The collage consists of three distinct images. At the top right is a 'Health Alert' document from the Philadelphia Department of Public Health, dated 9/25/2024, titled 'Hazardous Industrial Chemical Detected in Philadelphia's Drug Supply'. It lists 'SUMMARY POINTS' including the identification of bis(2,2,6,6-tetramethyl-4-piperidyl) sebacate. Below this is a poster with a black background and yellow text that asks 'Cough? Chemical smell?' and states 'Industrial chemical found with fentanyl locally.' It includes a 'DRUG CHECKING' illustration and a 'TESTED.' graphic. At the bottom is another poster featuring a cartoon character in a yellow hat, with text warning about a 'new industrial chemical' causing bad cough, ringing ears, blurred vision, and puking, and advising to 'Stop using if you smell it.' It also mentions 'THE GRAND RAPIDS Red Project' and provides contact information for harm reduction programs.

Image sources: Philadelphia Department of Public Health, The Grand Rapids Red Project

Myths

- Fentanyl laced marijuana / vapes
 - No cases confirmed by toxicology
- Overdose from touching fentanyl
 - No cases confirmed by toxicology
- Naloxone-resistant opioids
 - Opioids respond to naloxone
 - Non-opioids (like xylazine) do not
- Higher doses of naloxone are better
 - Lower doses plus rescue breathing are best, repeat as necessary
- "Rainbow Fentanyl" or fentanyl targeted at children
 - Colorful products appeal to adults too, and help differentiate from competition

Image source: DEA

Challenges – Current Drug Trends

- Inconsistent reporting, despite legislation
- No centralized repository or standards for seizure or toxicology data
 - Kilos vs. pounds vs. dosage units
 - Liquids vs. Pills
- Lags in toxicology results
- Scheduling --> changes in drug supply
 - Example: Xylazine --> Medetomidine
- Intentionality and timing often unknown

Possible Public Health Responses

- Train health professionals
 - Overdose response
 - Withdrawal management
 - Wound/symptom ID and care
 - Compassion/stigma
- Language matters: Avoid words like "zombie drug" and "flesh eating". Instead use drug names and clinical language.
- Remove barriers to accessing treatment
- Messaging for the public/people who use drugs
 - Naloxone, rescue breathing, rescue position – almost always found with opioids
 - Notify of presence of new substances with recommendations and resources
 - Offer self-care and self-advocacy education including wound care kits, hygiene products, etc.
- Collaborate and communicate with public safety partners about what you're seeing
- Drug checking programs

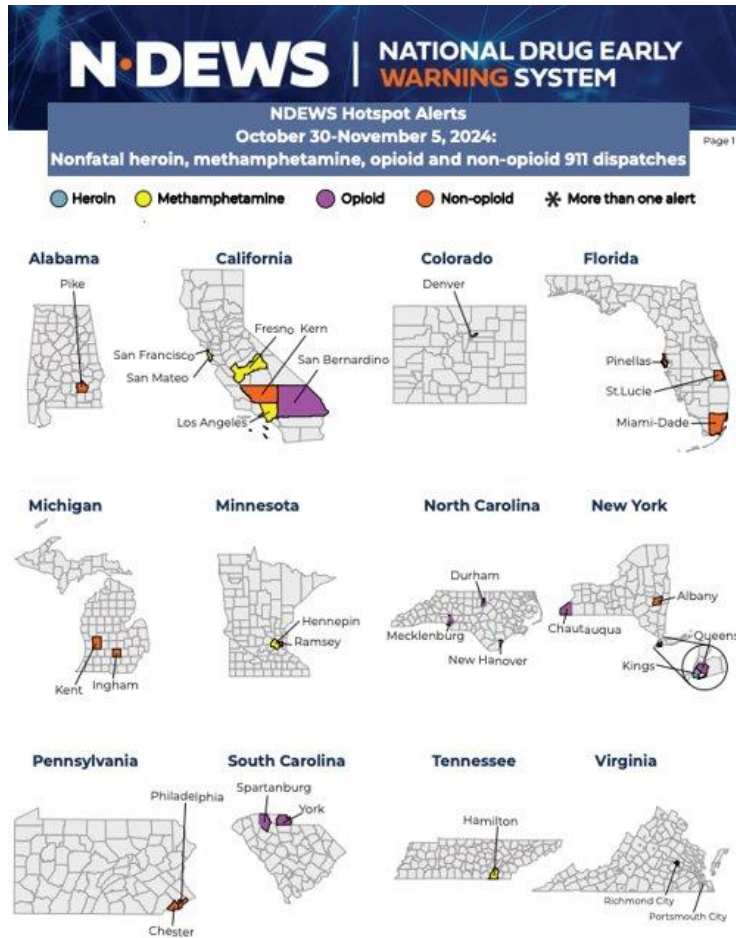

Possible **Public Safety** Responses

- Test for novel substances - Use paraphernalia laws and make direct requests to labs for comprehensive testing
- Monitor incoming shipments for illicit substances
- More controlled deliveries to identify drug trafficking organizations
- Update protocols, train first responders to look for respiration
- Avoid excessive amounts of naloxone – can cause precipitated withdrawal
- Schedule drugs carefully – anticipate replacement substances and increased rates of overdose, at least temporarily
- Monitor for safety issues for officers/staff as well as people who use drugs
- Notify public health partners when there are changes

Emerging Trends Resources – Pennsylvania Specific

Benzo Dope in Western PA

COUNTY(IES):
ALLEGHENY, BLAIR,
ARMSTRONG,
CAMBRIA

DATE(S): APRIL
2024?

NATURE OF EVENT:
BENZODIAZEPINE-
CUT DOPE
DETECTED

ADVERSE EVENTS: UNKNOWN

BENZODIAZEPINES, a class of central nervous system depressant used to treat anxiety and insomnia, have been identified in four samples of dope in four different counties in Western Pennsylvania. While benzodiazepines and opioids can be used safely together when prescribed by a doctor, given their potentiating effect on opioids, they are a particularly dangerous cut when mixed with illicit opioids of unknown potency. The risk of marked respiratory depression, coma and even death is higher with so-called "benzo-dope" than with "tranq-dope" or fentanyl alone. While benzodiazepines do not respond to naloxone, the opioid reversal agent is still indicated for benzo-dope ODs since it will mitigate the synergy of the combined drugs by neutralizing the effects of fentanyl.

PA GROUNDHOGS supplies benzodiazepine test strips with its field kits. If you live in the western part of Pennsylvania we strongly encourage you to use them. For a primer on how to use immunoassay strips [click here](#).

Drug Checking — Quarterly Report

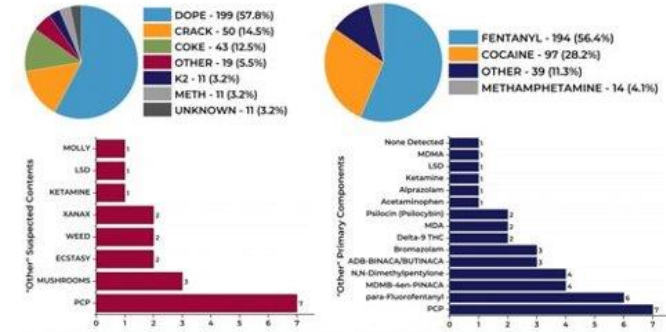

PHILADELPHIA, PENNSYLVANIA | DRUG CHECKING | Q1 & Q2 2023

PURPOSE: This report provides up-to-date information regarding the drug supply in Philadelphia, Pennsylvania, United States of America, including quantitative data on the purity of fentanyl, xylazine, cocaine, methamphetamine, and more in various sample types analyzed.

OVERVIEW: Traditional drugs (e.g., heroin, fentanyl, cocaine, methamphetamine) are commonly identified among drug samples in cities across the United States, albeit at varying purities and combinations. Novel psychoactive substances (NPS) continue to appear within the drug supply, masked as traditional drugs or added to traditional drug preparations. Nationally, the drug supply remains a dynamic and evolving environment, with respect to the active drug components, cutting agents, and/or adulterants added to drug preparations. The drug supply and drug use trends can be different from city to city or even within a given community, requiring specific regional or local assessments. Accurate understanding of drug materials and the drug supply in real-time is imperative for effective public health and safety preparedness and response.

OBJECTIVE: A partnership between the Center for Forensic Science Research and Education (CFSRE) and the Philadelphia Department of Public Health (DPH) has been established to accurately assess the drug supply in Philadelphia, Pennsylvania. Samples were provided to PDPH staff conducting field-based harm reduction supply distribution and forwarded to the CFSRE for analysis. The CFSRE laboratory utilizes novel approaches for the analysis of drugs using comprehensive non-targeted data acquisition by gas chromatography mass spectrometry (GC-MS) and liquid chromatography quadrupole time-of-flight mass spectrometry (LC-QTOF-MS). The scope of analysis for testing contains more than 1,300 drugs, including a vast majority of NPS and relevant substances. This initiative was established as a comprehensive effort examining various drug materials and drug forms. All drug testing results are summarized in this report, with notable results selected for emphasis. Note: The results reported herein represent a subset of the drug supply and do not represent the drug supply in its entirety.

SUSPECTED CONTENTS vs. PRIMARY COMPONENT

SUMMARY & RECENT NOTABLE FINDINGS

- 344 samples were analyzed between January 1, 2023, and June 30, 2023.
- N-Desethyl Isotonitazene** (n=3) was detected in dope samples alongside fentanyl, xylazine, bromazolam, flubromazepam, and caffeine.
- Bromazolam** (n=2) was detected without opioids in purported dope samples.
- Coke (n=6) & crack (n=4) samples contained fentanyl. One methamphetamine sample contained fentanyl; however, it was noted as known contamination.
- Nearly all dope samples (99%) contained fentanyl and/or para-fluorofentanyl.
- Over the last 12 months, the average amount of fentanyl in dope samples remained mostly consistent while the average amount of xylazine increased 34%.

Table 1: Descriptive Statistics for Drug Amount* Based on Suspected Contents

Drug	Suspected	N	Mean	Median	Min.	Max.
Cocaine	Coke	42	37.0%	32.9%	6.4%	85.2%
Lidocaine	Coke	31	24.6%	16.8%	1.1%	55.0%
Xylazine	Coke	8	14.4%	4.8%	0.9%	44.8%
